Release Abstract

This document describes specifications, restrictions, and corrections in the Affirmed Networks Charging Gateway Function (CGF) Release 1.0.2.3

Upgrade Path

This release supports upgrades from Release 1.0.2.0.

Server Hardware and Software

Virtual Machine

The CGF can run on either of the following virtual machines:

- Virtual Machine on the HP ProLiant DL380p Gen8 Server
- Virtual Machine on a blade of the HP BladeSystem c7000

Specifications

The following table lists the hardware and software specifications for running CGF on a virtual machine.

Table 1-1 Hardware and Software Specifications for VM Platform

Specification	Description
I/O Performance	250 MB per sec. minimum 500 MB per sec. recommended For a VM deployment with more CPUs allocated, a higher I/O capacity is recommended.
Disk Size	1.6 TB and higher OR SAN Storage with large capacity mounted on each node
CPU	20 vCPU <i>Note: If the system has more vCPUs available, you can increase the number of CPUs to 48 once the package has been deployed.</i>
Memory	32 GB
Networking	▪ MCC > CGF: 1 GB or higher ▪ CGF > BSS/OSS: 1 GB or higher

Specification	Description
Operating system	▪ VMware ESXi and OVA template package ▪ Red Hat Enterprise Linux 7.3 Openstack Platform 10 (Newton) and MySQL Virtualization Archive template package

Restrictions and Special Considerations

The following restrictions and special considerations apply to this release.

Restriction/Special Consideration	Description
37963 File Age Limit setting	In CgfServiceConfig.xml, the File Age Limit is set to “disabled” by default. You can set the File Age Limit to “enabled” to purge files that are older than 180 days.

Problems Fixed

This release includes the following correction.

Anomaly	Description
AN-52209 When CGF is upgraded, zookeeper config file was getting overwritten with default zookeeper configurations.	The upgrade script has been modified so that when CGF is upgraded, the zookeeper config file will not be overwritten with default configurations.

Upgrading CGF Software

To upgrade CFG software:

1. On the *primary node*, run the following rpm command.

```
rpm -Uvh -nodeps <cgfRpmPackageName>
```

After running the rpm command, run the following script from the primary node.

```
/opt/affirmed/cgf/bin/upgradeNodes.sh
```

When prompted, enter the full CGF RPM Package Path.

```
/opt/affirmed_cgf-1.0.2.2-13.noarch.rpm
```

After the upgrade, the default config files under

`/opt/affirmed/backup/cgf/conf_orig` (default files) are copied under
`/opt/affirmed/backup/old/cgf/conf_orig` (orig files).

User script files under `/opt/affirmed/backup/scripts_user` (user scripts) are copied under `/opt/affirmed/backup/scripts_user` (user scripts).

User-modified config files are retained and merged with the latest files from the RPM/new release. User-modified config files under `/opt/affirmed/cgf/CgfService/conf` (user-modified config files) are copied/merged under
`/opt/affirmed/backup/old/cgf/conf_user` (user-modified config files).

Any attribute values that were changed in the *CgfServiceConfig.xml* file are maintained after the upgrade.
